

ABSTRACT OF THE DISCLOSURE

In a circuitry assembly, a first insulative sheet is disposed between first electric wires and second electric wires intersecting each other. A wiring member holds the first electric wires and the second electric wires. The circuitry assembly is accommodated in a casing body of an electrical junction box. Each of the first electric wires held by the wiring member is press-fitted to a first terminal to be electrically connected therewith. Each of the second electric wires held by the wiring member is press-fitted to a second terminal to be electrically connected therewith.
